- Tidal resource
- Resource characterisation
- History of tidal energy
- Technology review
- Conclusion

Physical basis

- Two major concepts of turbines:

- Wind turbine

- Tidal turbine

- Axial flux

- Transverse flux

Physical basis

- Power in a flow:

$$P_{flow} = \frac{1}{2} \rho S V^3$$

with: ρ fluid density

S swept area (turbine surface)

V fluid velocity

- Proof...

Physical basis

- Power of a turbine:

$$P_{turb} = \frac{1}{2} \rho C_P S V^3$$

with: ρ fluid density

S swept area (turbine surface)

V fluid velocity

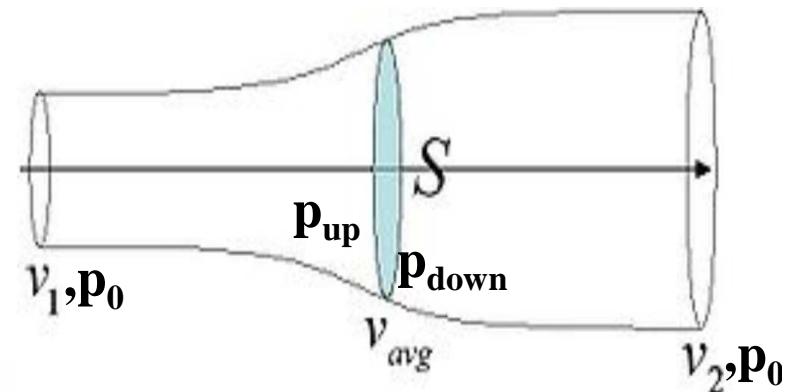

- where C_P is the power coefficient.
not to be confuse with lift (portance) coefficient in French C_p

Physical basis – Betz theory

- Assessment of the C_P value:

- Similar to wind energy
 - Betz theory applicable

- Power: $P = F.v$

- Bernouilli: $p_{\text{up}} - p_{\text{down}} = \frac{\rho}{2}(v_1^2 - v_2^2)$

- Force: $F = (p_{\text{up}} - p_{\text{down}})S = \frac{\rho}{2}(v_1^2 - v_2^2).S$

- Velocity approximation: $v = \frac{(v_1 + v_2)}{2}$

Physical basis – Betz theory

- Power: $P = F.v = \frac{\rho}{2}(v_1^2 - v_2^2).S.v$

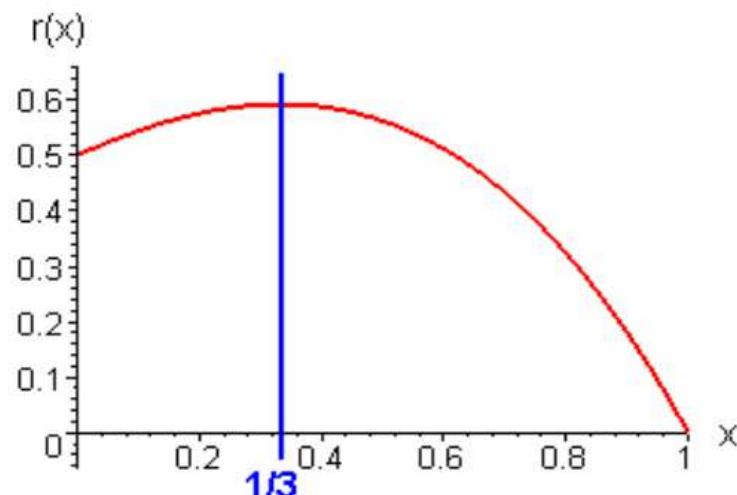

- Ratio: $r = \frac{P}{P_0} = \frac{1}{2}(1 - x^2)(1 + x)$ with $x = \frac{v_2}{v_1}$,

- Betz theory

$x=1/3$, et alors $r=16/27$

D'où la limite de Betz :

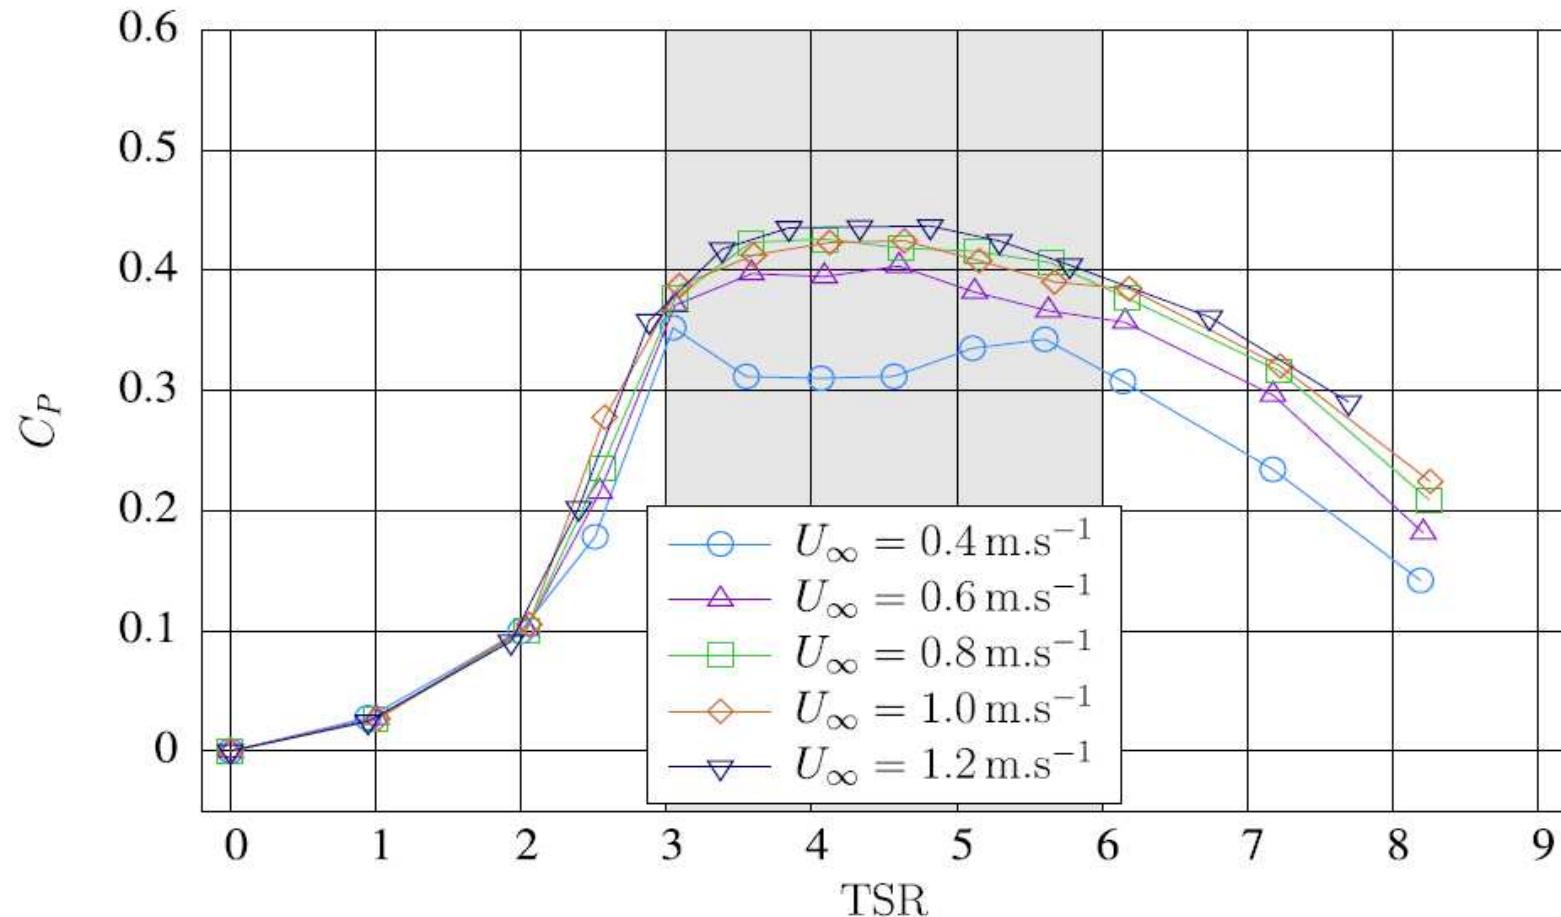

$$P_{extraite}^{max} = \frac{16}{27} P_{incidente}$$

Physical interpretation...

Physical basis – Betz theory

- Real Cp curve, TSR = $\Omega R/U$

Physical basis – Betz theory

□ Real Cp curve

- Physical Basis
- Fundamentals of tidal energy
- Tidal resource
- Resource characterisation
- History of tidal energy
- Technology review
- Conclusion

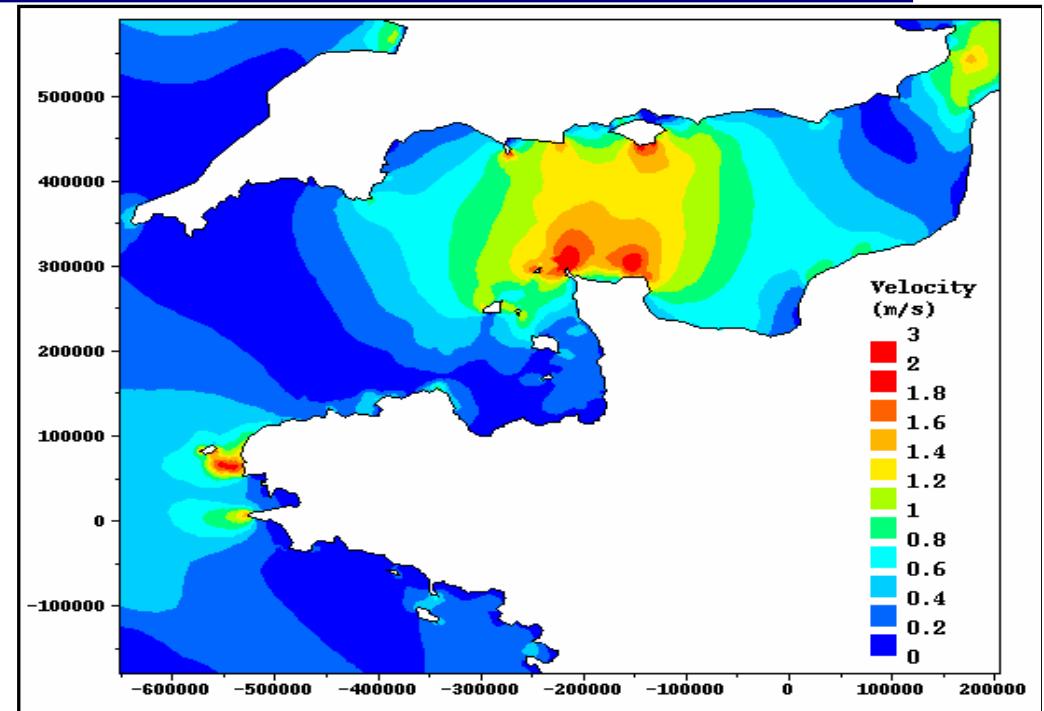

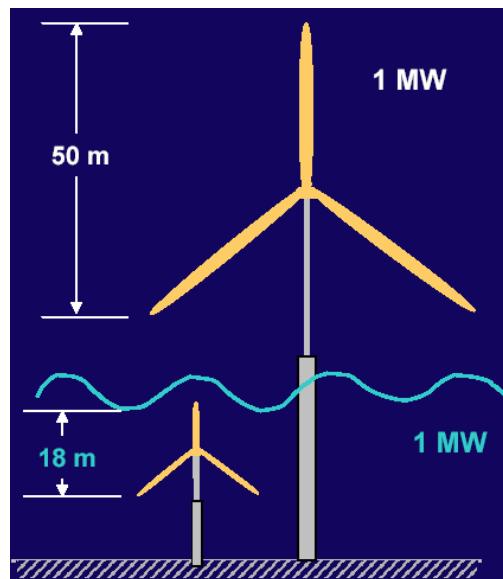

Fundamentals of tidal energy

- Power $\approx 0.5 \rho C_p S V^3$
 $C_p=0.4$
- 1MW wind turbine:
 - Air density $\rho \approx 1,23 \text{ kg/m}^3$
 - Wind velocity $V \approx 13\text{m/s}$
 - Turbine diameter: **50 m**
 - Water density $\rho \approx 1000 \text{ kg/m}^3$
 - Current velocity $V \approx 13\text{m/s} \text{ (?)}$
 - Turbine diameter: **1.7m**
 - Unfortunately,
more likely $V \approx 2,7\text{m/s}$
 - Turbine diameter: **18m**

Fundamentals of tidal energy

- Power $\approx 0.5 \rho C_p S V^3$
- 1MW wind turbine:
 - Unfortunately more likely $V \approx 2.7 \text{ m/s}$
 - Turbine diameter: **18m**

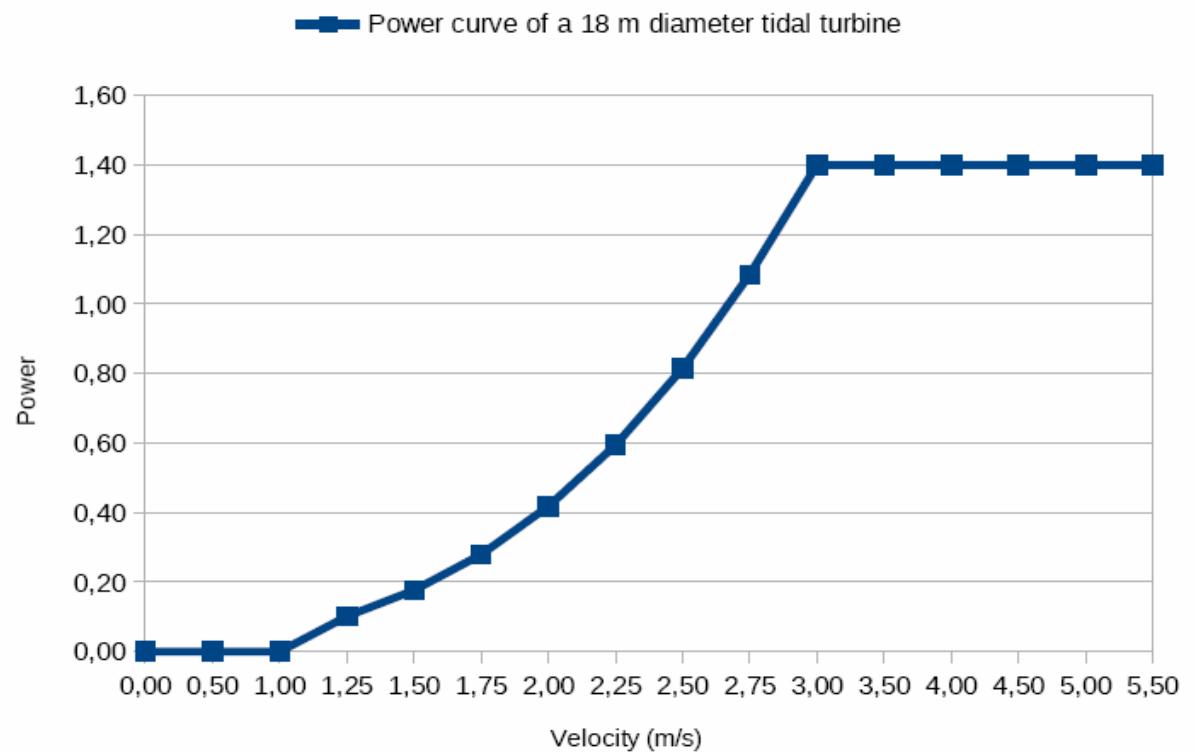

- Maybe we could think about turbine **rated** at lower velocity?

Fundamentals of tidal energy

- Rated velocity? And a Cut in velocity?
 - An example, a 18 meters diameter turbine

Power (MW)	Velocity (m/s)
0,00	0,00
0,50	0,00
1,00	0,00
1,25	0,10
1,50	0,18
1,75	0,28
2,00	0,42
2,25	0,59
2,50	0,82
2,75	1,08
3,00	1,40
3,50	1,40
4,00	1,40
4,50	1,40
5,00	1,40
5,50	1,40

Press Centre > 2014 > 10 > Alstom improves the performance of its tidal energy solutions with Oceade™ 18 – 1.4MW

[All from Press Centre](#)

Alstom improves the performance of its tidal energy solutions with Oceade™ 18 – 1.4MW

01/10/2014

Alstom has taken advantage of its experience with the 1 MW turbine to improve the design of its tidal stream turbine. We are now offering the Oceade™ 18 - 1.4 MW, making the turbine even more efficient, cost-effective and easy to maintain.

With a rotor diameter of 18 metres, the Oceade tidal stream turbine has a nominal power of 1.4MW and three variable pitching blades. It is equipped with plug-and-play modules on rails, easily accessible through an inspection hatch at the rear of the nacelle to enable faster assembly and maintenance. This turbine is buoyant, making it easy to tow to and from the operating site. Installation and maintenance costs are therefore lower because there is no need for specialist vessels and divers. It also reduces the timeframe to install or retrieve the turbine. The unit rotates to face the incoming tide at an optimal angle and thus extract the maximum energy potential.

The Oceade is ready to be deployed at the tidal energy farm that will be selected in the call for expressions of interest launched in September 2013 by the French government.

Tidal resource

- To obtain the 7,4TWh given by Bahaj & Myers for the Alderney Race, one would need

≈2780 turbines

like the 1.4 MW
(with 18 meters diameter
rotor)

- Possible but work still need to be done...

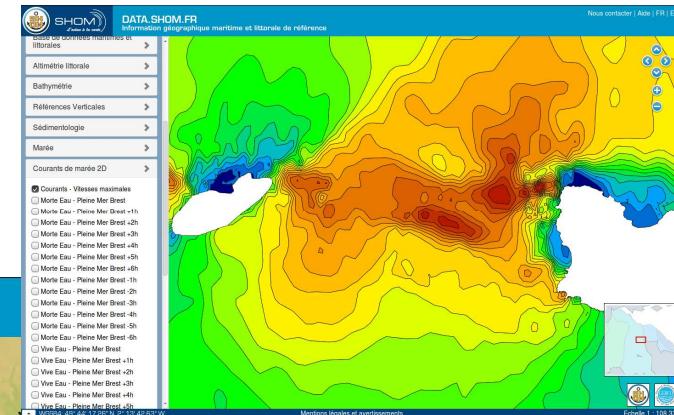

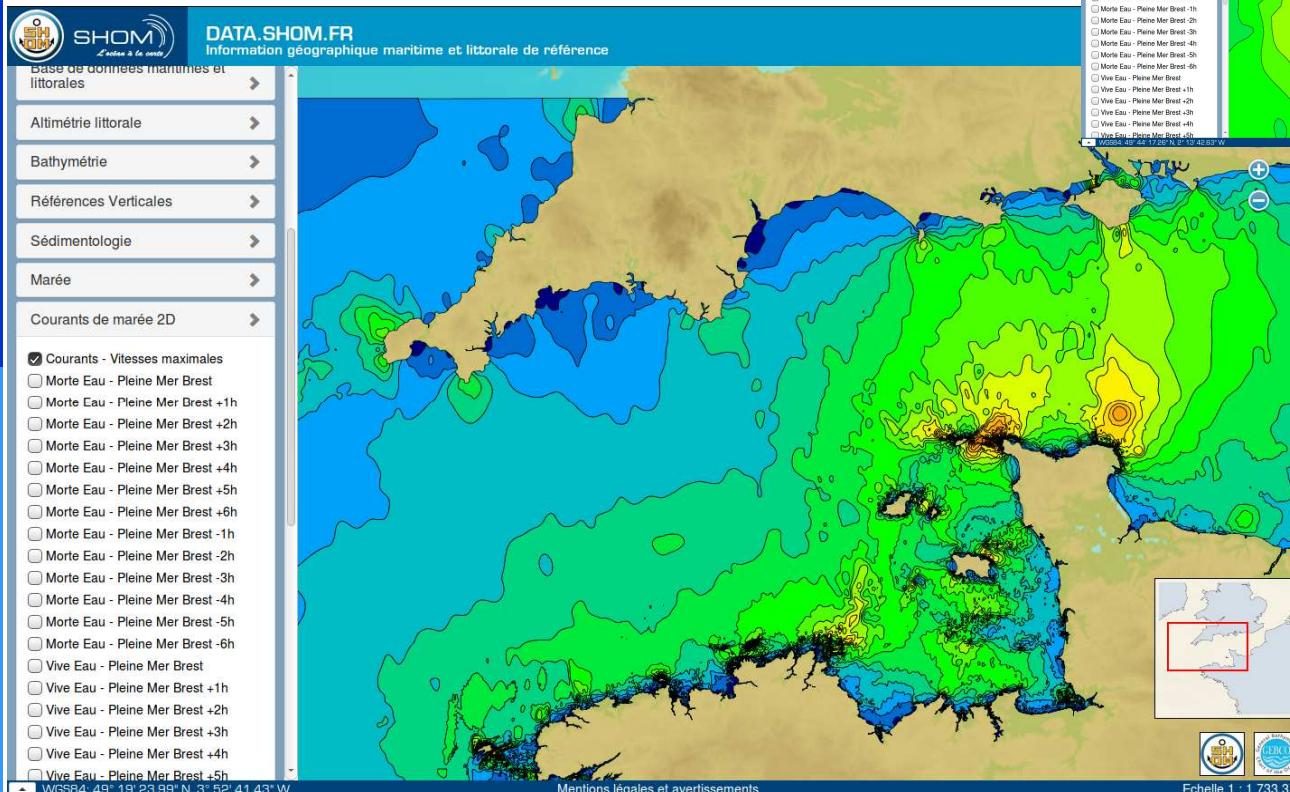

Outline

- Conclusion

History of tidal energy

- « Moulin à marée »
- Could be back from the roman age?
To be confirmed...
- Then in the middle age.
- Mainly in Brittany, Pays de la Loire, etc.

More than 100 sites in France

History of tidal energy

- “Barrage de la Rance”

- Capacity: 240 MW
 - 24 turbines
 - Yearly prod: 500 GWh
 - Ratio: 23,8%

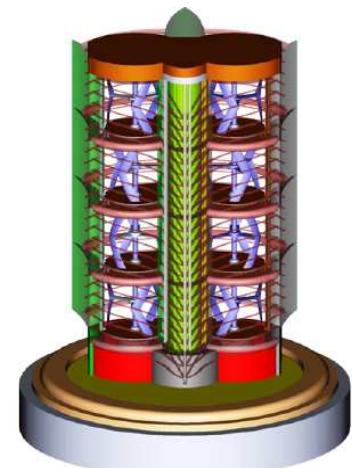

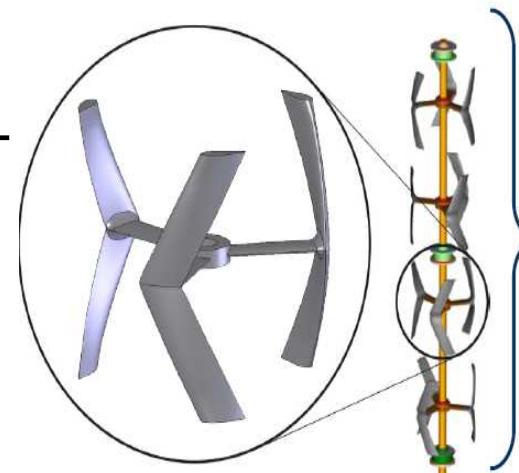

- Inaugurated in 1666

- Drawbacks:

- Sediment
 - Eutrophysation
 - Fish and marine mammals

History of tidal energy

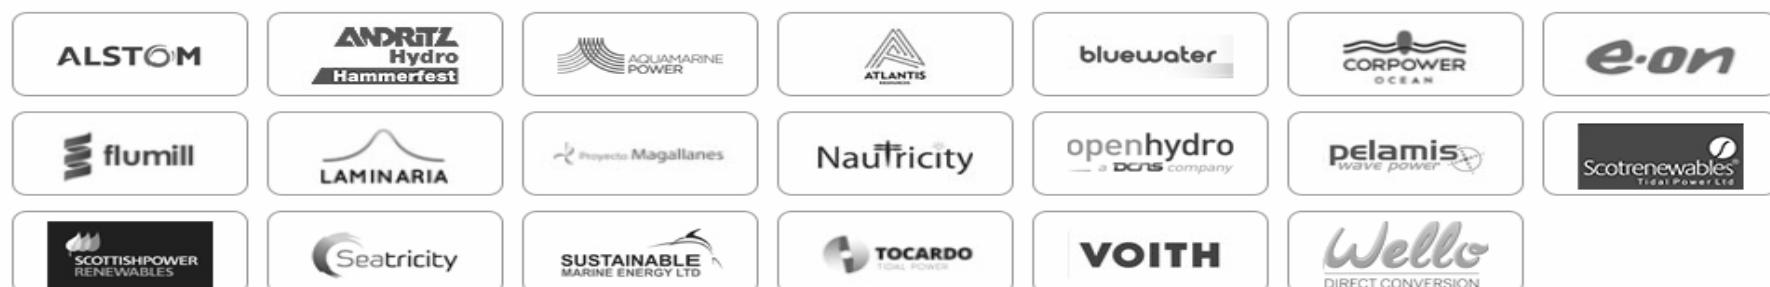

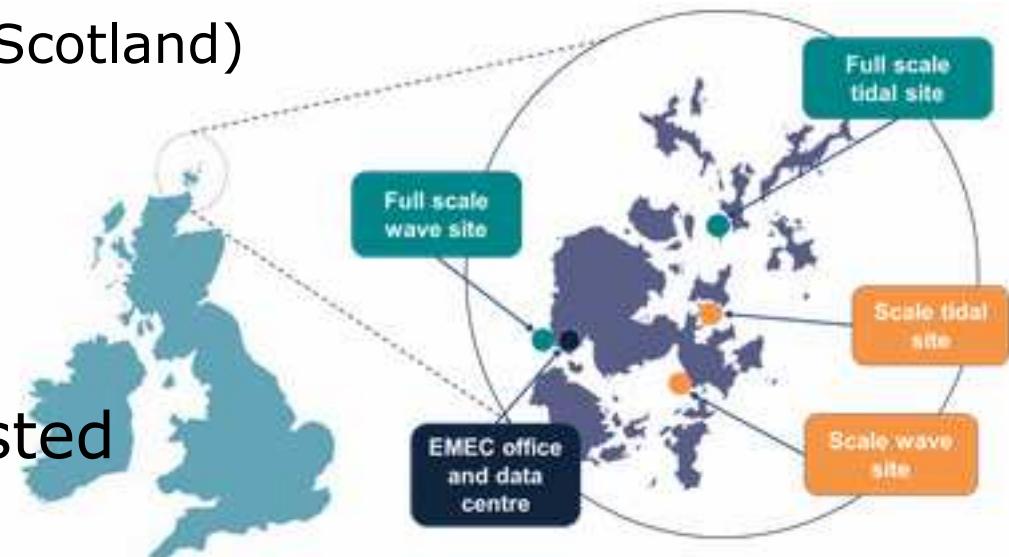

- Programme “HARVEST”
 - Research and development programme
- Inaugurated in 2001
- Advantages:
 - Self starting
 - Direction
 - Several in a column

History of tidal energy

- EMEC (European Marine Energy Center)
 - In Orkney (North of Scotland)
- Established in 2003
- Tidal
 - Wave, etc.
- Many companies tested their prototype.

History of tidal energy

- SEAGEN, Marine Current Turbine

- Strangford Narrows
 - Northern Ireland
 - 1 twin-turbine

- Inaugurated 18/12/2008

- Drawbacks:

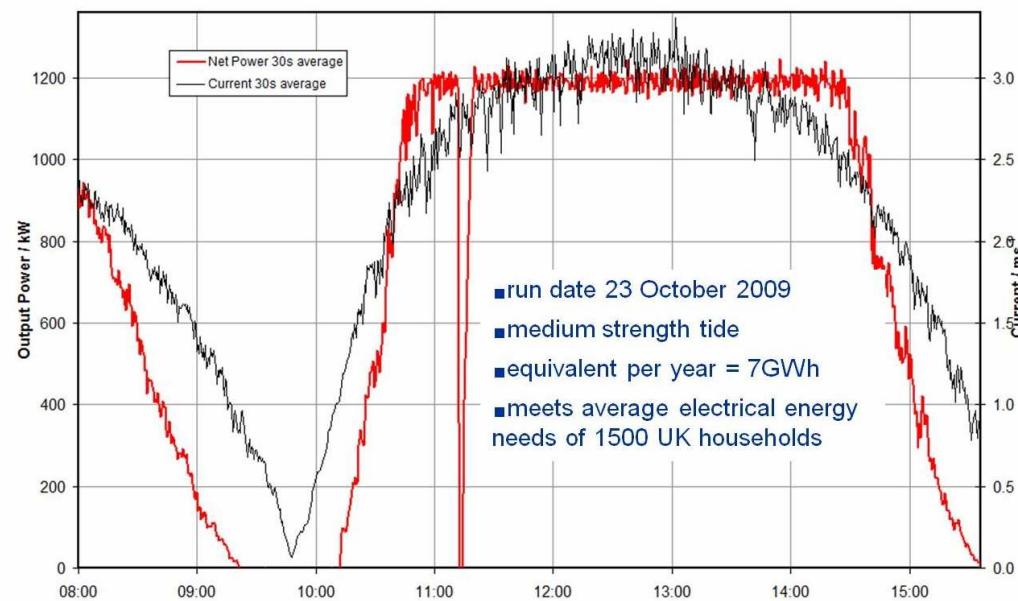

- Fishing
 - Sailings
 - Fish and marine mammals
 - Noises...

History of tidal energy

□ SEAGEN, Marine Current Turbine

- The “1st tidal” turbine in open water
- Rated at 2,4m/s

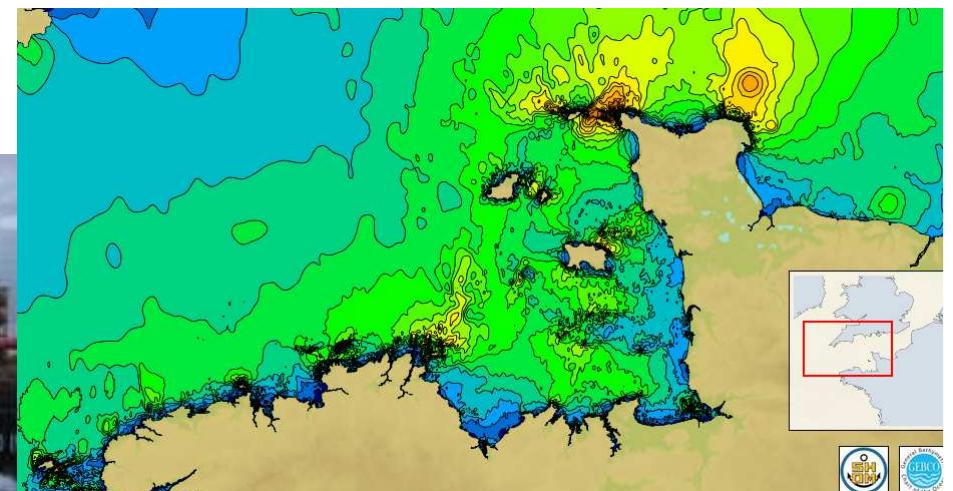

History of tidal energy

- Since these times:
 - Many, many, many projects...
 - Especially in UK, northern Europe, Canada, US, Italy, and of course France
 - Focus at the French level.

History of tidal energy

- Open Hydro in Paimpol Bréhat
 - End 2011: first Open Hydro turbine
 - Sept. 2012: barge and crane problem
 - The tidal turbine stays in the water
 - Other turbines deployment is stopped.
 - Few communication since

History of tidal energy

□ Sabella in Ouessant

- After a test period for its Sabella D3 10kW in Odet river (started in 2008)

□ June 2015

- Sabella D10
- 10 meters diameter
- Depth 55m
- Connected to the grid in Sept./Oct. 2015
 - Phone recharge during the summer

History of tidal energy

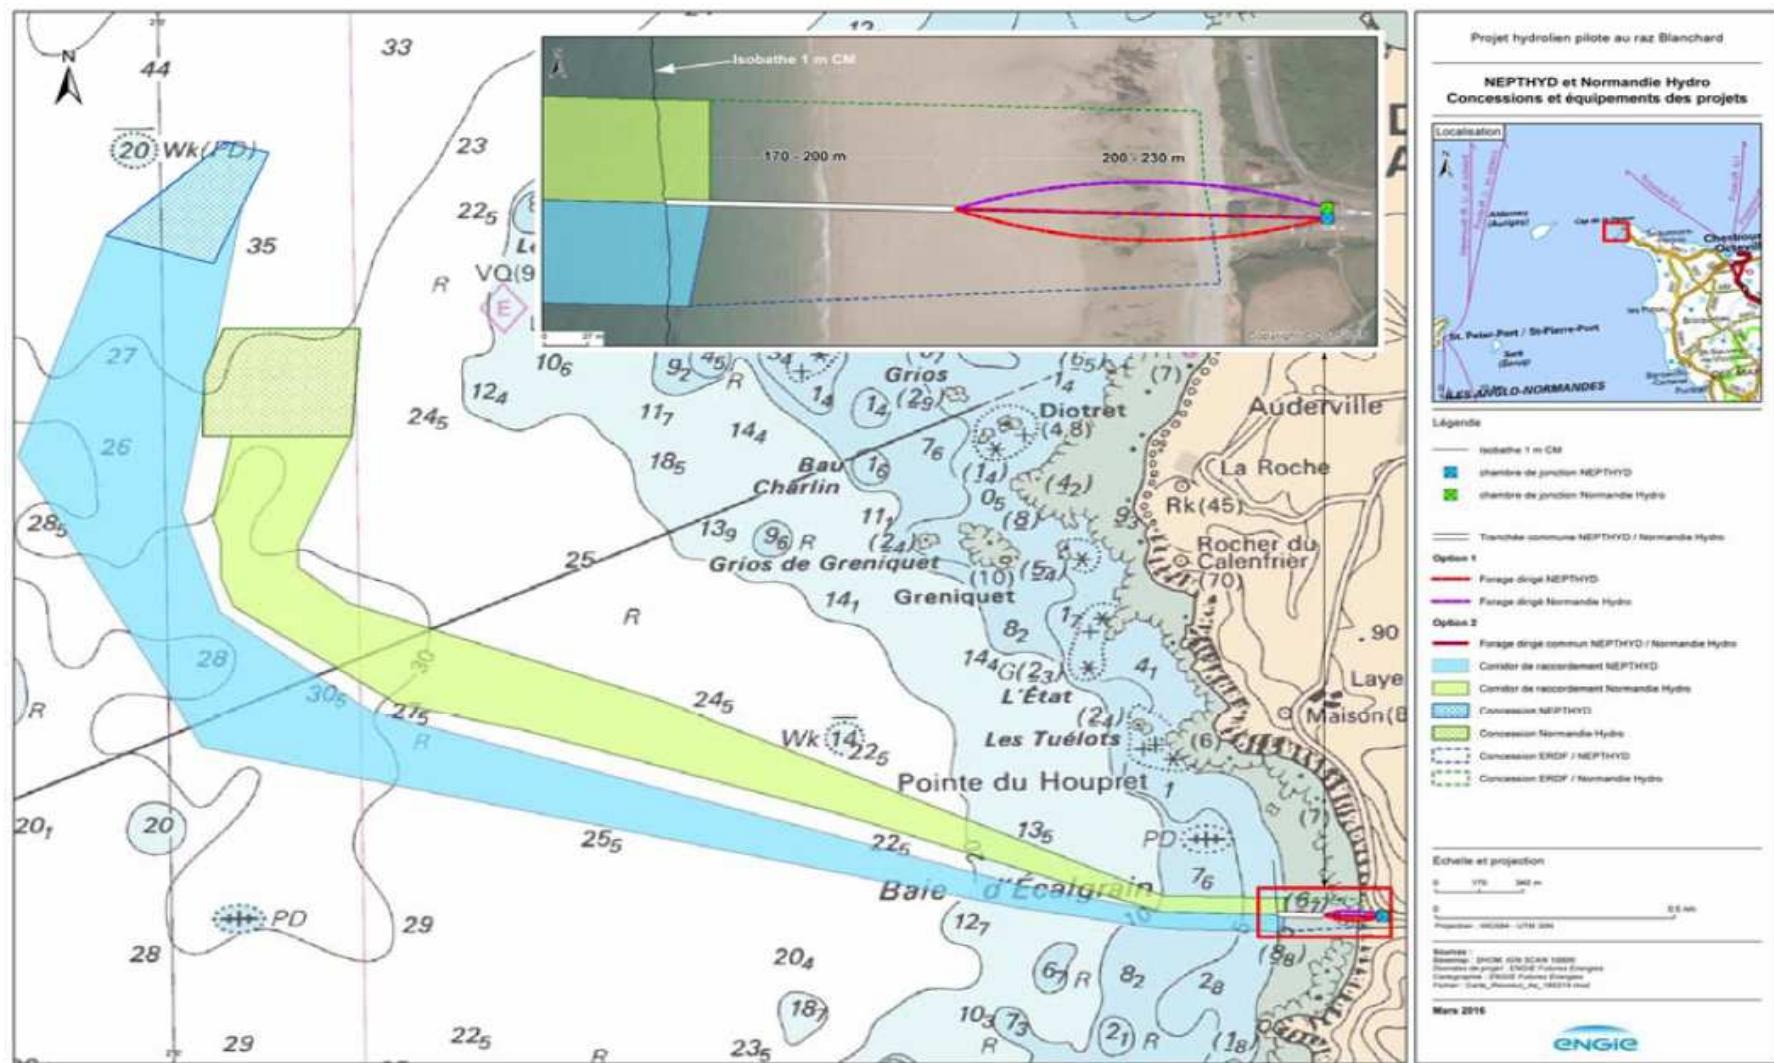

- Follow up of “HARVEST” programme

A Orléans, HYDROQUEST raccorde la première hydrolienne fluviale (ou marine ou estuarienne...) au réseau électrique de distribution géré par ERDF (25 septembre 2015)

History of tidal energy

History of tidal energy

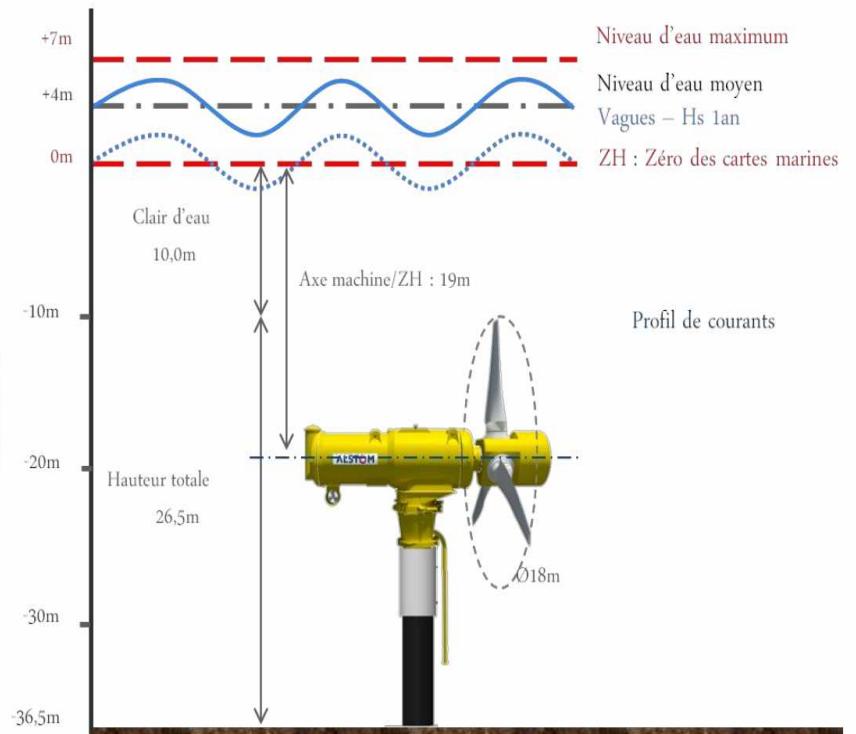

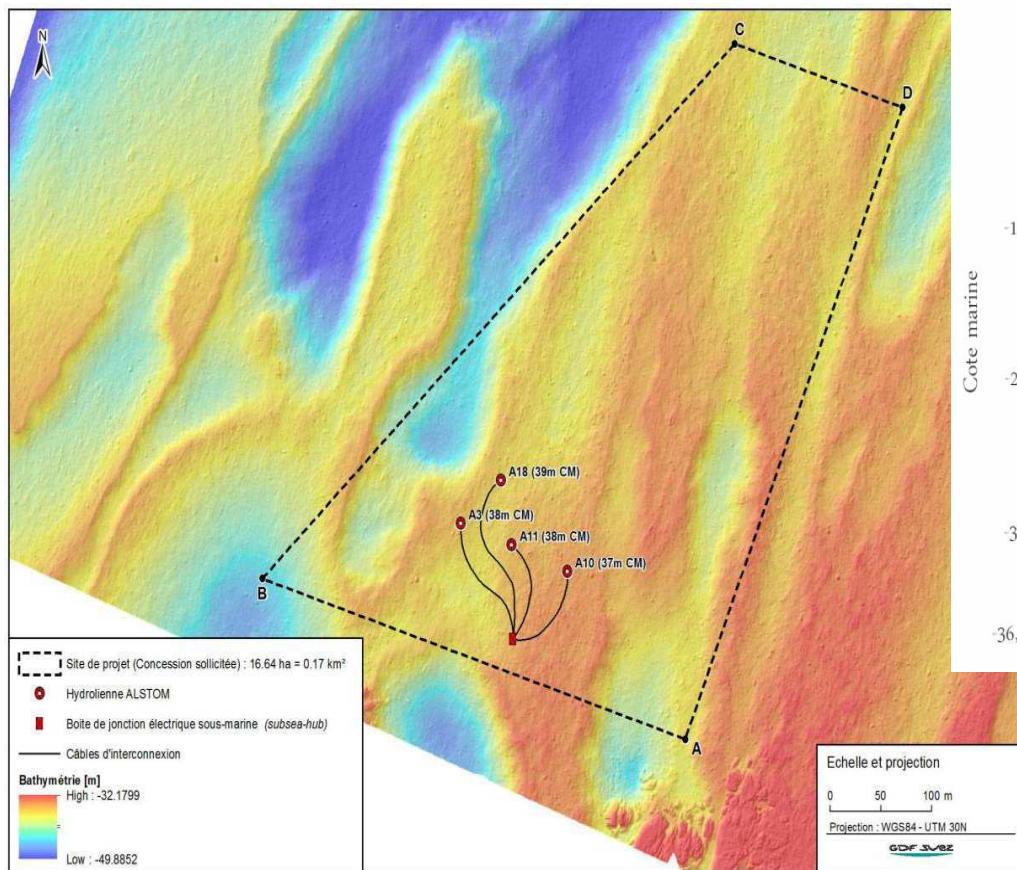

□ NEPHYD

- 4 hydroliennes de type ALSTOM OceadeTM (1,4 MW – Diam 18m)
- Total de 5,6 MW et un productible total de 14,9 GWh/an
(fonctionnement de l'ordre de 2 000 heures par an)

Éléments	Spécifications
Position du rotor	Face au courant
Nombres de pales	3
Diamètre du rotor	Environ 18 m
Hauteur minimale entre le haut des pales et la surface marine	10 m
Dimension de la turbine (sans les pales)	$L = 20 \text{ à } 23 \text{ m}$, $I = 3,5 \text{ à } 4 \text{ m}$
Vitesse de rotation des pales <i>et vitesse instantanée en extrémités de pales</i>	Entre 3 et 19 tr/mn ($3 \text{ à } 18 \text{ m/s}$) Optimale : 14 tr/mn (13 m/s) Médiane : 10 tr/mn (9 m/s)
Vitesse de courant de démarrage	Environ 0,7 m/s
Vitesse de courant optimale de production	$> 3,1 \text{ m/s}$

History of tidal energy

□ NEPHYD

In case of extreme waves...

History of tidal energy

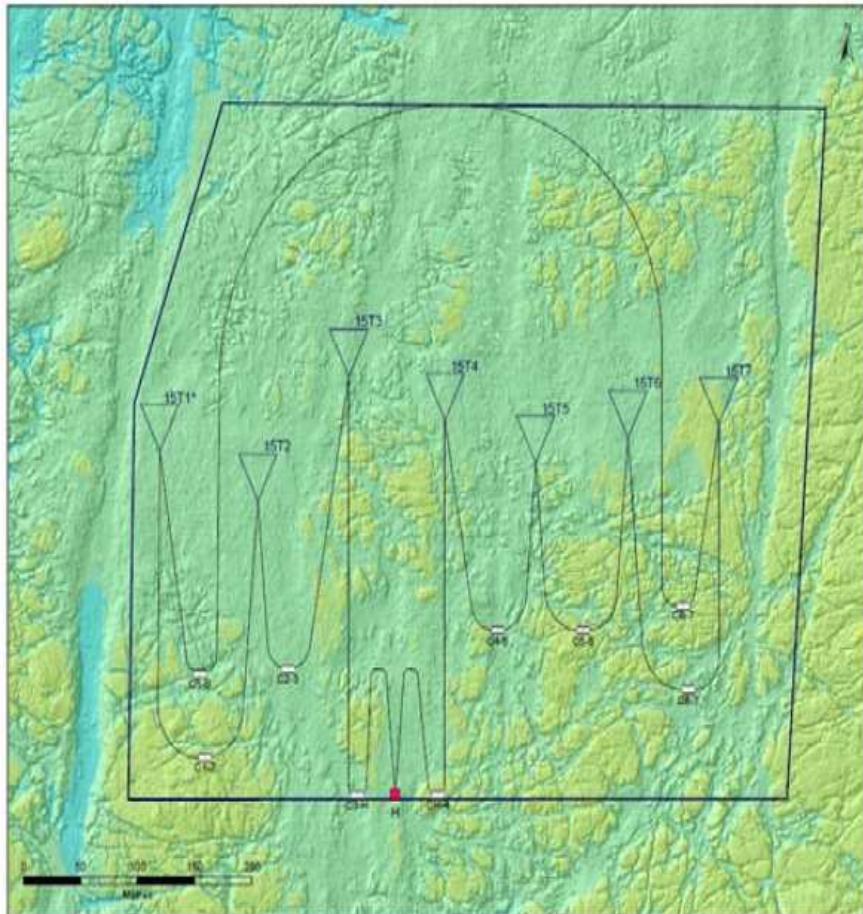

□ Normandie Hydro

- 7 hydroliennes de type Open Hydro DCNS (2 MW – Diam \approx 13 m)
- Total de 14 MW et un productible total de 28 GWh/an (fonctionnement de l'ordre de 2 000 heures par an)

Eléments	Spécifications
Position du rotor	Fonctionnement bidirectionnel (au flot et au jusant sans modification d'orientation)
Nombres de pales	10
Diamètre du rotor	
- intérieur	4 m
- extérieur	<i>Environ 13 m</i>
Hauteur minimale entre le haut du carénage de la turbine et la surface marine	9 à 10 m
Dimension de la turbine (carénage)	L = 9 m, diamètre = 16 m,
Vitesse de rotation des pales et vitesse instantanée en extrémités de pales	Maximale non connue
- intérieures	< 12 tr/mn 90% du temps
- extérieures	< 2.5 m/s 90% du temps < 8.2 m/s 90% du temps
Vitesse de courant de démarrage	< 1 m/s
Vitesse de courant optimale de production	n.c.

History of tidal energy

□ Normandie Hydro

Tidal energy – Hydrolien, Oct. 2016

Grégoire Pinon, LOMC, CNRS, Univ. Normandie (Le Havre)

History of tidal energy

- MeyGen in Scotland
 - Sept. 2016
 - First foundations
 - Pentland Firth
 - Developed by Atlantis Resources
 - 4 x 1.5 MW turbines
 - 1 Andritz Hydro
 - 3 AR1500 Atlantis

Outline

- Physics of tide and resource
- Physical Basis
- Fundamentals of tidal energy
- Tidal resource
- Resource characterisation
- History of tidal energy
- Technology review
- Conclusion

Technology review

- Presentation of Jean-Luc Achard.

Technology review

□ EEL Energy

Outline

- Physics of tide and resource
- Physical Basis
- Fundamentals of tidal energy
- Tidal resource
- Resource characterisation
- History of tidal energy
- Technology review
- Conclusion

Conclusion

- Objectifs 2020 : Paquet « **climat - énergie** »
(Europe et Grenelle de l'environnement)
 - **-20%** d'émission de CO₂ par rapport à 1990
 - voire -30% si accord international après 2012
 - **-20%** de consommation d'énergie
 - **20%** d'énergie renouvelable dans la consommation finale d'énergie
- L'IFREMER estime que pour 2020 :
 - **7,7%** (Energies Renouvelables de la Mer) dont :
 - **5,2%** pour l'éolien off-shore
 - **2,5%** pour les autres (hydronienne, ETM, vagues, etc.)
- Encore plus en 2025 ou 2030...
